What Is Alprazolam (Xanax)?

Alprazolam's generic name is alprazolam, and it belongs to the benzodiazepine class of medications, commonly sold under the brand name Xanax. It is a fast-acting, prescription-only tranquilizer used mainly for anxiety disorders and panic attacks in adults.

Key medical uses include:

- Generalized anxiety disorder (GAD)
- Panic disorder, with or without agoraphobia

- Short-term relief of severe anxiety symptoms, sometimes including associated insomnia or situational stress under medical supervision.

Because alprazolam acts on GABA receptors in the brain, it can promote calming effects, reduce overthinking, ease restlessness, and improve your ability to function during periods of overwhelming stress when used exactly as prescribed.
